*Includes contracts
**Includes Independent Member, Annual Meeting and Report, Technical Report Production, and Committee Meetings
***As required by each party. In recent years there have been no committee expenses.
Inspection and repair of the Skins Lake Spillway plunge pool and apron

Starting at the end of August 2018, after the conclusion of the Summer Temperature Management Program (STMP), Rio Tinto is planning an inspection and repair, as required, of the Skins Lake Spillway plunge pool and apron.

Proposed activities include the installation of diversion pipes immediately after the STMP concludes, draining the plunge pool and salvaging fish as required. It is presently unknown how long the inspection and repair may take. The best case scenario is that the inspection will require one week and repair an additional week. However, it is possible that the inspection may reveal repair or remediation that could take up to 8 weeks to complete.

In order to facilitate the inspection and repair of the Spillway plunge pool in 2018, Rio Tinto is proposing to manage flow in 2018 as follows:

1) At the end of the STMP reduction of SLS discharge to 28 m$^3$/s via a single gate opening - Gate 2.
2) Install bypass pipes (2-3 days).
3) Open bypass to maximum (28 m$^3$/s).
4) Close Gate 2 to zero (discharge overlap of up to 30 minutes).
5) Maintain maximum discharge of 28 m$^3$/s through diversion pipes for duration of the inspection and repair project.

6) At the end of the project, open gate 2 to 32 m$^3$/s, then close and remove diversion pipe.

7) Calculate the Annual Water Allocation based on flow contributions as above.

8) Maintain average winter discharge in consideration of the above, as directed by the NFCP.

When the bypass pipes are installed the maximum discharge will be 28 m$^3$/s, $\pm$ 1 m$^3$/s. There may be a slight reduction in total diversion due to loss in head pressure as the reservoir elevation declines, but this is expected to be within 1 m$^3$/s. Flow meters will be installed in the diversion gates and observed flows will be used to calculate the Annual Water Allocation. The expected change in stage in the Upper Nechako River, based on discharge-stage graphs on the Water Survey of Canada website is +/- 0.02 - 0.04 m.

**Decision Record**

The Technical Committee has considered this request in the context of the NFCP mandate and does not have an objection to this request.

Brian Naito, Fisheries and Oceans Canada

Justus Benckhuysen, Rio Tinto

ian Spendlow, BC FLNROD

David Levy, Independent Member
